PRODUCT DIRECTION

Future Roadmap

A forward-looking, honest view of where the Amir Ventures mobility platform is headed. Everything here is planned or under exploration — directional, not a commitment or a delivery date.

WHERE WE ARE

Building from a live foundation

The Driver app, Dispatcher command center, and Firebase backend are already in daily production for a working transportation company. This roadmap describes where we intend to take that platform next.

The items below are grouped by **horizon** — near-term, on the horizon, and exploring. They reflect the direction of our work, not a schedule. We do not attach hard dates, and we sequence work by what the operating fleet needs most at any given moment.

How to read this roadmap

This is directional. Priorities shift with what operating fleets tell us matters most, so items may move between horizons, change shape, or be reworked as we learn.

HORIZON	FOCUS
Near-term	Reliability at the moment of dispatch
On the horizon	More reach, control, and automation
Exploring	Earlier ideas under active consideration

NEAR-TERM

Making sure a job is never missed

Our nearest focus is reliability at the moment of dispatch — that a driver hears the offer, sees the clock, and that owners can see how the operation is running.

- **Louder, more reliable driver alerts**

Exploring critical-alert-style notifications so a driver is more likely to hear a new job even with the phone quiet or a driving focus mode on.

- **Driver-facing visible countdowns**

Planned surfacing of the scheduled-offer countdown timer directly to the driver, so time-to-respond is always in view.

- **Deeper analytics and reporting for owners**

Planned richer reporting on top of daily production so owners get a clearer picture of dispatch, trips, and earnings.

ON THE HORIZON

More reach, more control, more automation

Beyond the near-term, we are looking at broadening where dispatch can run, giving finer control over zones and settlement, and letting the backend do more of the routine work.

- **Desktop / Mac dispatcher experience**

Exploring a larger-screen dispatcher experience to complement today's iOS, Android, and iPad apps.

- **Broader and finer geofencing controls**

Planned expansion of the geofenced-zone tooling so dispatchers can shape and manage zones with more precision.

- **Richer commission and settlement reporting**

Planned deeper reporting around per-driver commission owed, configurable rates, and weekly settlement.

- **More automation in dispatch**

Exploring additional Cloud Function automation for routing, reassignment, and reminders to reduce manual steps.

EXPLORING

Where the platform could grow next

These are earlier ideas we are actively considering. They are exploratory and not committed to any horizon yet.

- **Additional languages**

Exploring support beyond today's English, Russian, and Uzbek.

- **Passenger-facing touchpoints**

Exploring ways to connect the passenger into the trip experience alongside the driver and dispatcher apps.

- **Integrations**

Exploring connections to outside systems that operating fleets already rely on.

PRINCIPLES

What guides the roadmap

Every decision about what to build next runs through the same small set of principles.

- **Real production feedback**

We build from what the operating fleet actually experiences in daily use, not from assumption.

- **Reliability first**

Getting a job dispatched, heard, and completed comes before new surface area.

- **Keep it simple**

The one-action trip flow and clear dispatch board stay easy to use as capability grows.

- **Reversible, low-risk changes**

We favor changes that can be rolled back or gated, so daily production stays stable.

Horizons	Near-term · On the horizon · Exploring
Commitment level	Planned / exploring — no fixed dates
Sequencing	Driven by operating-fleet priorities
Non-negotiable	Reliability and per-licensee isolation

This roadmap is a starting point for a conversation. If a particular direction matters to your operation, **let's talk** — your priorities help shape what we build next.
